

*Design Project 1: [Release 2]*

# Airline Flight Reservation Server (AFRS)

Team 1: Niharika Reddy, Stephen Cook, Joshua Cotton, Moisés Lora

1.

# Impacts of R2 Requirements

## Impacts of Release 2

### High

- Allowing for multiple concurrent client connections.

### Medium

- Undo and Redo operations for reservations
- GUI

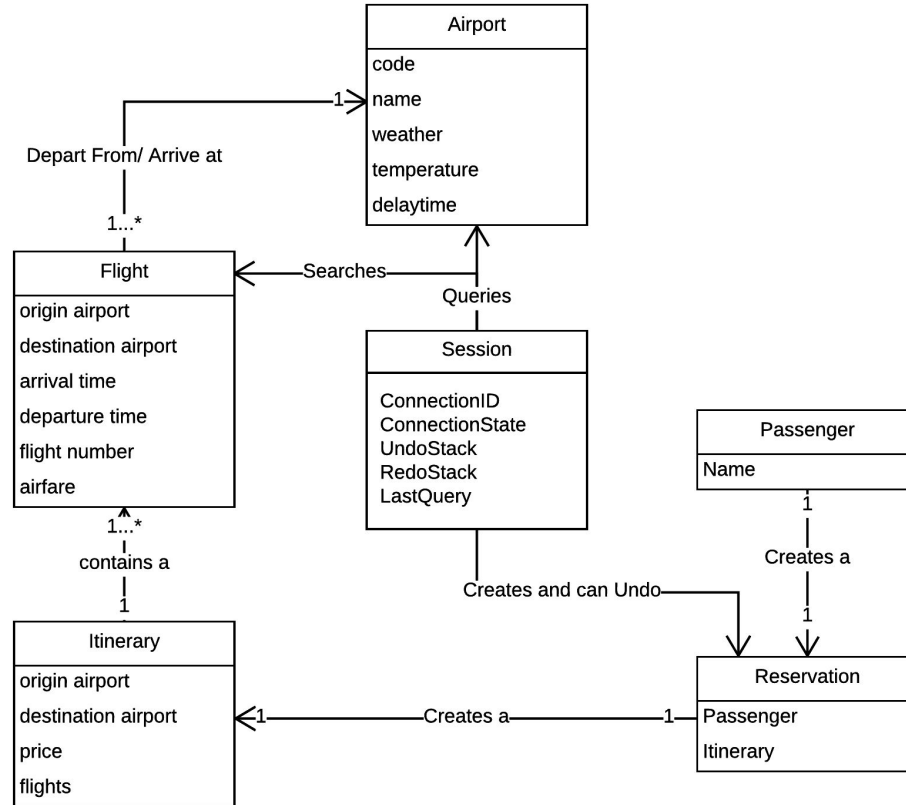

### Low

- Setting up the FAA server proxies

2.

## Domain Model

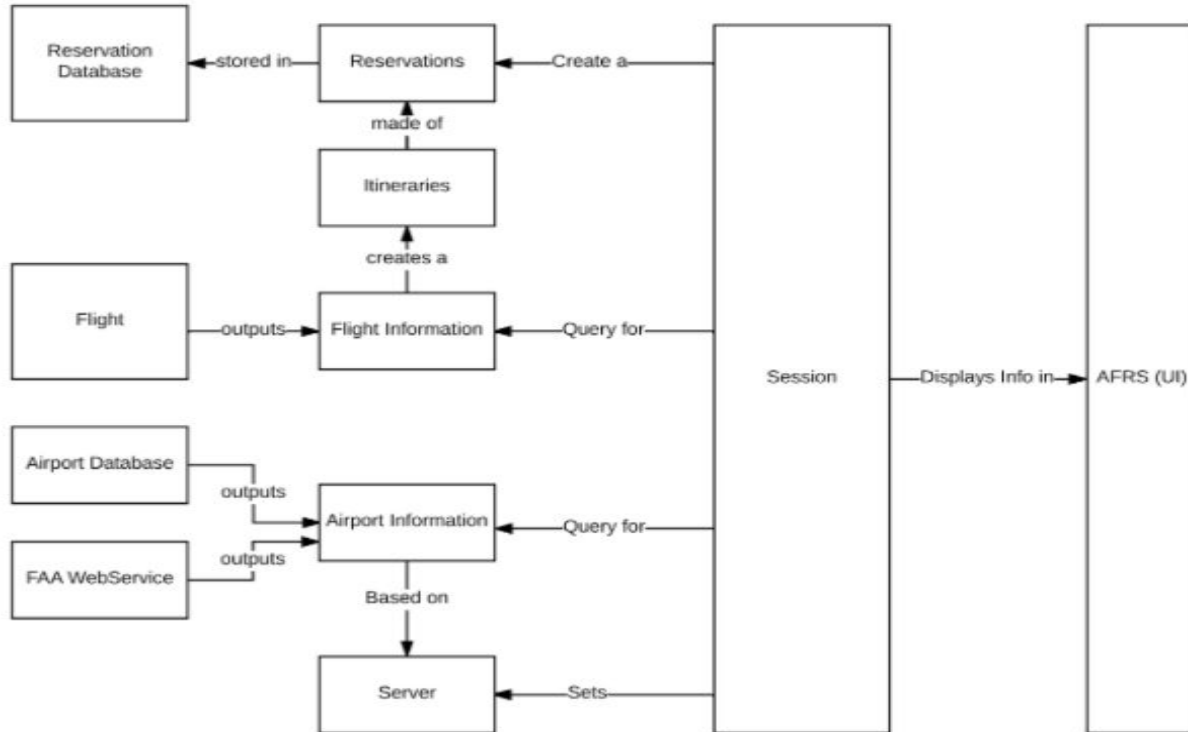

# Domain Model

3.

# System Architecture

# System Architecture

4.

# Subsystems

# User Interface Subsystem

- Commands
  - Undo/redo
  - Connect/disconnect
  - The Session now represents the invoker
- GUI
- InputParser class

# User Interface Subsystem

AFRS

Create New Connection

Connection 1 X Connection 2

# User Interface Subsystem

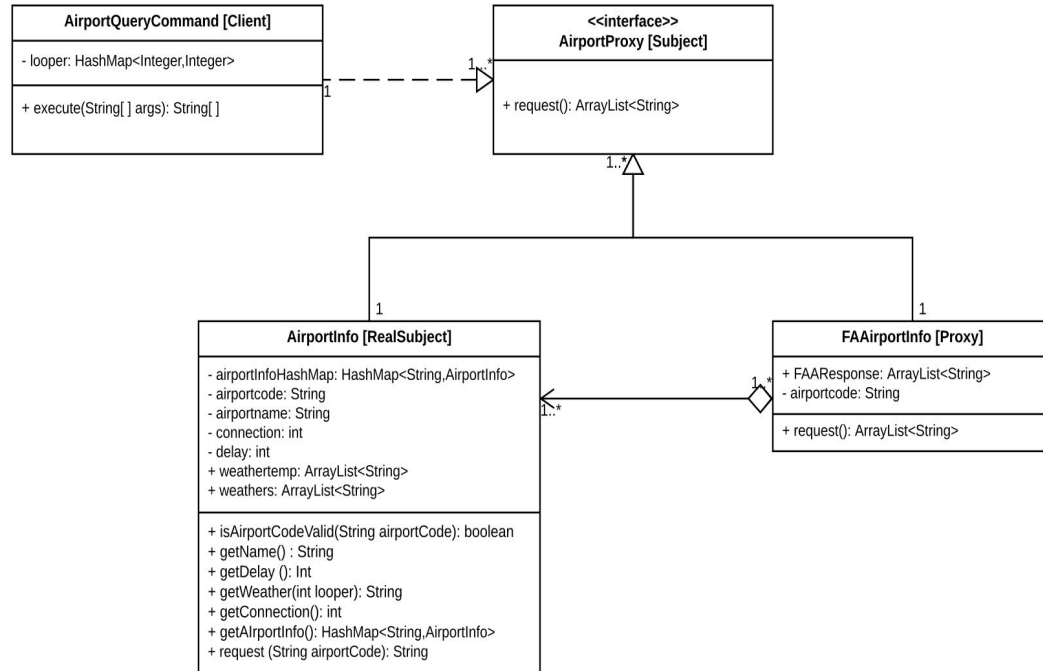

# Airport Information Subsystem

## Proxy Pattern:

- Remote Proxy pattern was chosen to handle FAA web service requests
- Proxy class (FAAAirportInfo) provides a placeholder to provide access to an object
- FAAirportInfo class provides a level of indirection for when the client requests airport information
- Allows for higher security measures, in case the connection is unsuccessful

# Airport Information Subsystem

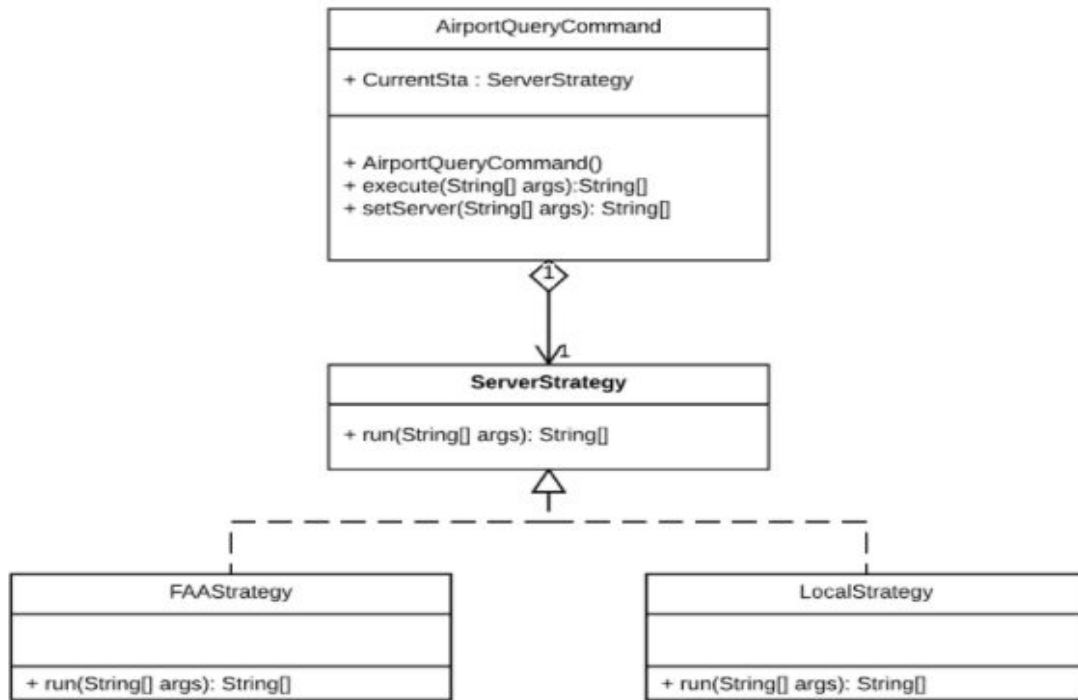

# Airport Information Subsystem

## Strategy Pattern:

- The “implementation” that the system had to choose between was whether to query from:
  - Local Test Files
  - FAA Server
- Added the ability to expand the system while still following Open Close Principle

# Airport Information Subsystem

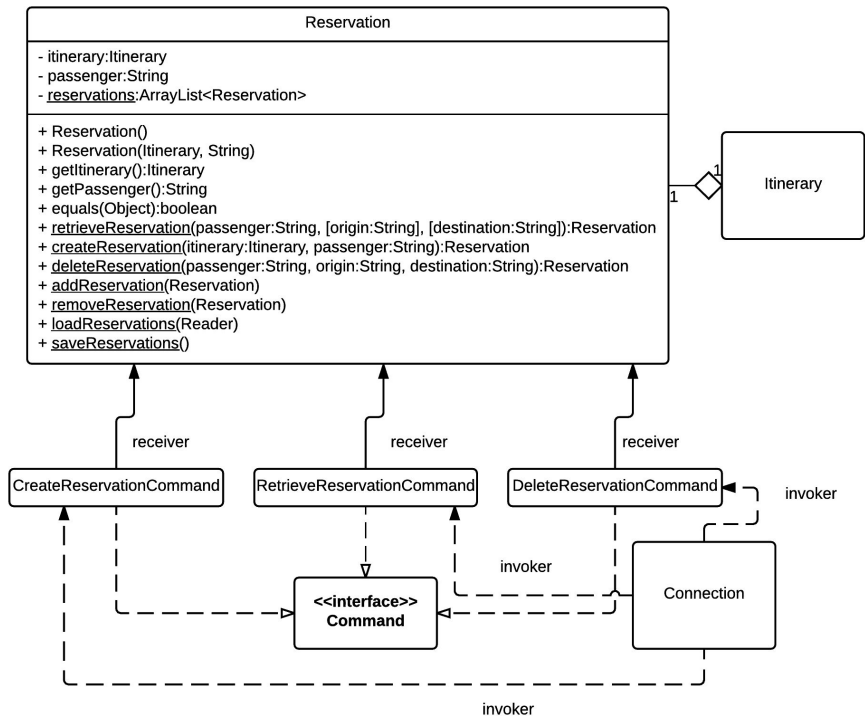

# Reservation Subsystem

- Persistence
- Undo/redo
- No changes to Reservation class for multiple connections

# Reservation Subsystem

# Connection Subsystem

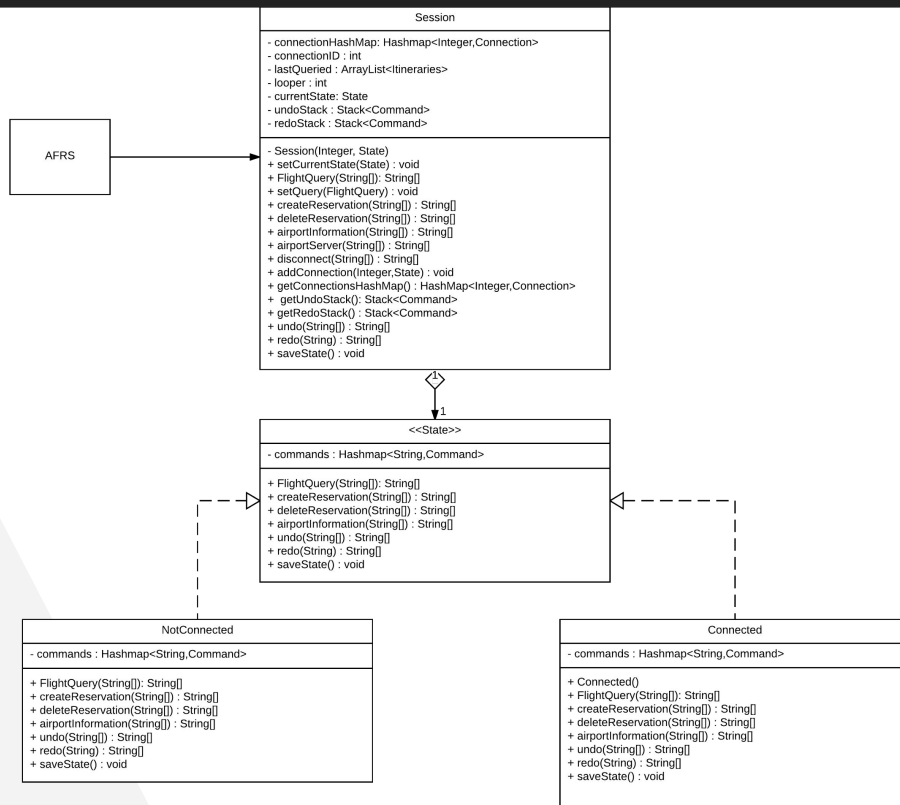

## State Pattern:

- State Pattern was used to handle the two states of a Session:
  - Connected and Not Connected
- When connected, user has full functionality
- When not connected, user has no functionality.

# Connection Subsystem

# Connection Subsystem

5.

## Strengths and Weaknesses of our Design

# Strengths and Weaknesses

## Strengths

- Easy to extend (Open-Closed Principle was followed)
- Focused on finalizing design documentation before implementation
- All of the requirements were implemented due to effective design and planning

## Weaknesses

- Session subsystem class could turn into a GOD class if more requirements were to be added
- Copy-Paste-Programming (duplicate code) in the UI subsystem

# 6.

## Our Team's Process

# Team Process

## First Two Weeks... Agile Methodologies

- Semi-Weekly SCRUM meetings
- Communicated with the customer (Professor) to clarify requirements
- Individuals and interactions over processes and tools
  - Trello
  - Slack
  - Google Docs

## Last Week... Iterative Process

- Fix Design → Implement → Test → Repeat

# THANK YOU!

**Any questions?**
